3D Viewing

CS 4620 Lecture 10

Viewing, backward and forward

So far have used the backward approach to viewing

- start from pixel
- ask what part of scene projects to pixel
- explicitly construct the ray corresponding to the pixel

Next will look at the forward approach

- start from a point in 3D
- compute its projection into the image

Central tool is matrix transformations

- combines seamlessly with coordinate transformations used to position camera and model
- ultimate goal: single matrix operation to map any 3D point to its correct screen location.

Forward viewing

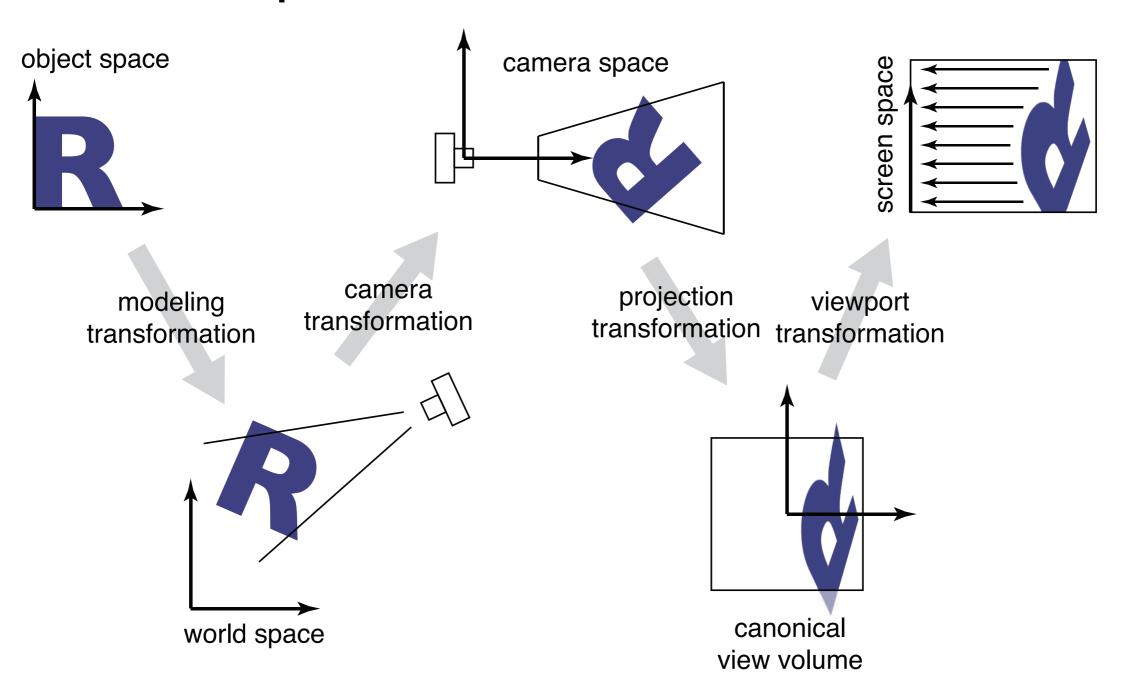

- Would like to just invert the ray generation process
- Problem I: ray generation produces rays, not points in scene
- Inverting the ray tracing process requires division for the perspective case

Mathematics of projection

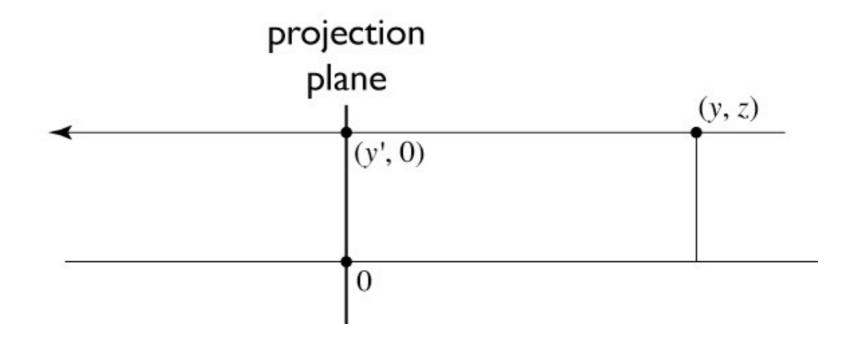

- Always work in eye coords
 - assume eye point at $\mathbf{0}$ and plane perpendicular to \mathbf{z}
- Orthographic case
 - a simple projection: just toss out z
- Perspective case: scale diminishes with z
 - and increases with d

Pipeline of transformations

Standard sequence of transforms

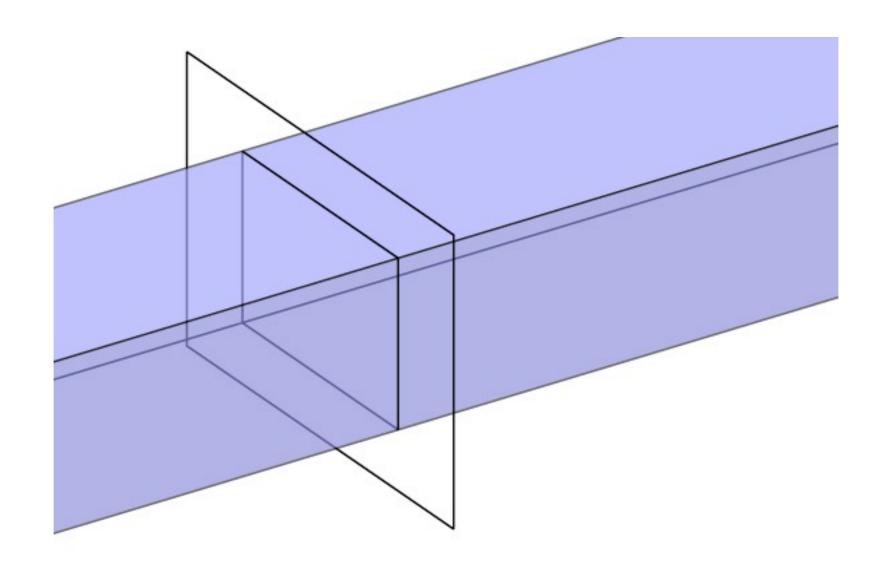

Parallel projection: orthographic

to implement orthographic, just toss out z:

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

View volume: orthographic

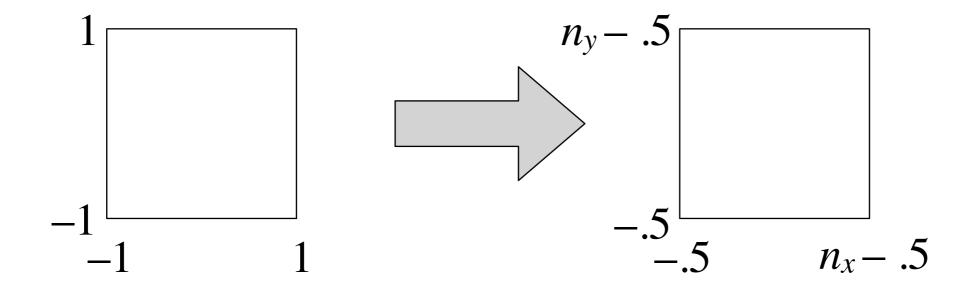

Viewing a cube of size 2

- Start by looking at a restricted case: the canonical view volume
- It is the cube [-I,I]³, viewed from the z direction
- Matrix to project it into a square image in [-1,1]² is trivial:

```
\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}
```

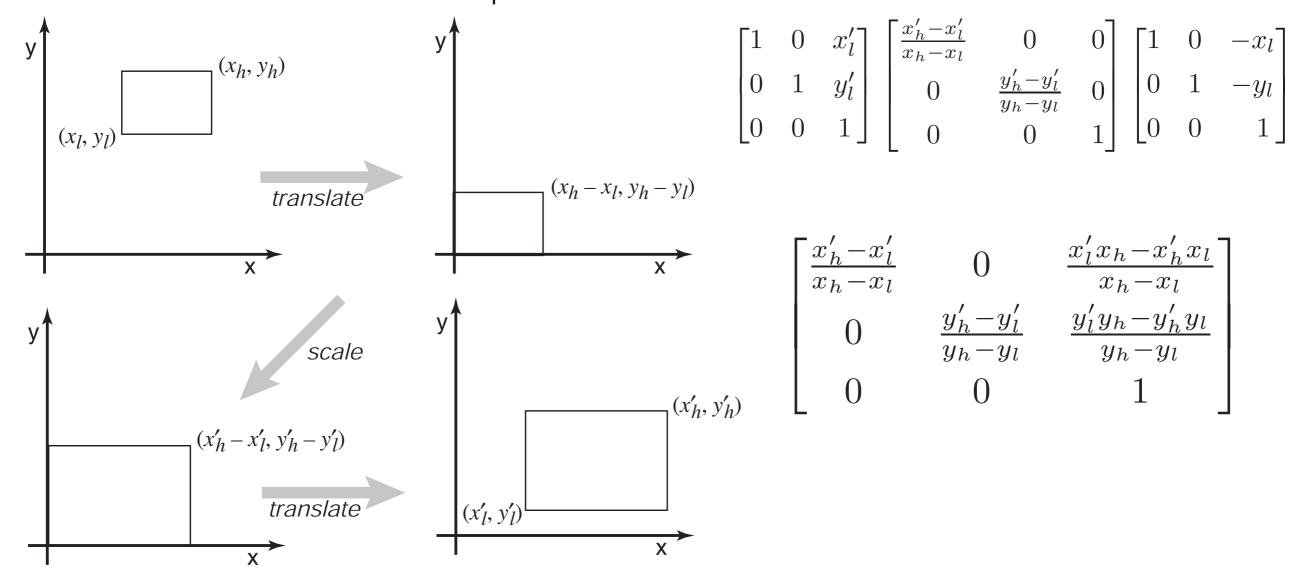

Viewing a cube of size 2

- To draw in image, need coordinates in pixel units, though
- Exactly the opposite of mapping (i,j) to (u,v) in ray generation

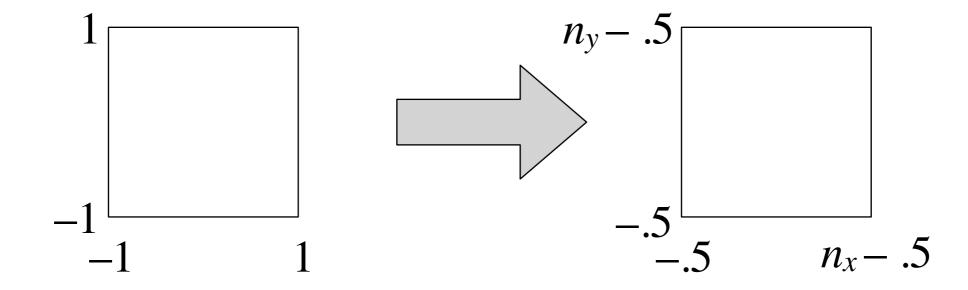

Windowing transforms

- This transformation is worth generalizing: take one axisaligned rectangle or box to another
 - a useful, if mundane, piece of a transformation chain

[Shirley3e f. 6-16; eq. 6-6]

Viewport transformation

$$\begin{bmatrix} x_{\text{screen}} \\ y_{\text{screen}} \\ 1 \end{bmatrix} = \begin{bmatrix} \frac{n_x}{2} & 0 & \frac{n_x - 1}{2} \\ 0 & \frac{n_y}{2} & \frac{n_y - 1}{2} \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x_{\text{canonical}} \\ y_{\text{canonical}} \\ 1 \end{bmatrix}$$

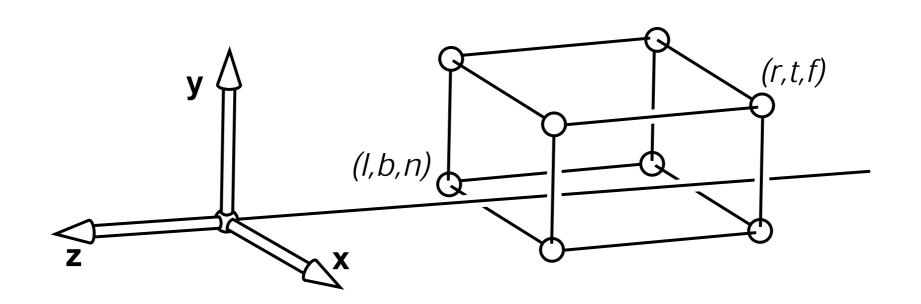

Viewport transformation

- In 3D, carry along z for the ride
 - one extra row and column

$$\mathbf{M}_{\text{vp}} = \begin{bmatrix} \frac{n_x}{2} & 0 & 0 & \frac{n_x - 1}{2} \\ 0 & \frac{n_y}{2} & 0 & \frac{n_y - 1}{2} \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Orthographic projection

- First generalization: different view rectangle
 - retain the minus-z view direction

- specify view by left, right, top, bottom (as in RT)
- also near, far

Orthographic projection

- We can implement this by mapping the view volume to the canonical view volume.
- This is just a 3D windowing transformation!

$$\begin{bmatrix} \frac{x'_h - x'_l}{x_h - x_l} & 0 & 0 & \frac{x'_l x_h - x'_h x_l}{x_h - x_l} \\ 0 & \frac{y'_h - y'_l}{y_h - y_l} & 0 & \frac{y'_l y_h - y'_h y_l}{y_h - y_l} \\ 0 & 0 & \frac{z'_h - z'_l}{z_h - z_l} & \frac{z'_l z_h - z'_h z_l}{z_h - z_l} \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{M}_{\text{orth}} = \begin{bmatrix} \frac{2}{r-l} & 0 & 0 & -\frac{r+l}{r-l} \\ 0 & \frac{2}{t-b} & 0 & -\frac{t+b}{t-b} \\ 0 & 0 & \frac{2}{n-f} & -\frac{n+f}{n-f} \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

Locating the camera

In constructing viewing rays we used the equation

$$\mathbf{o} = \mathbf{e}$$

$$\mathbf{d} = -d\mathbf{w} + u\mathbf{u} + v\mathbf{v}$$

- this can be seen as transforming the ray $(\mathbf{0}, (-d, u, v))$ by the linear transformation

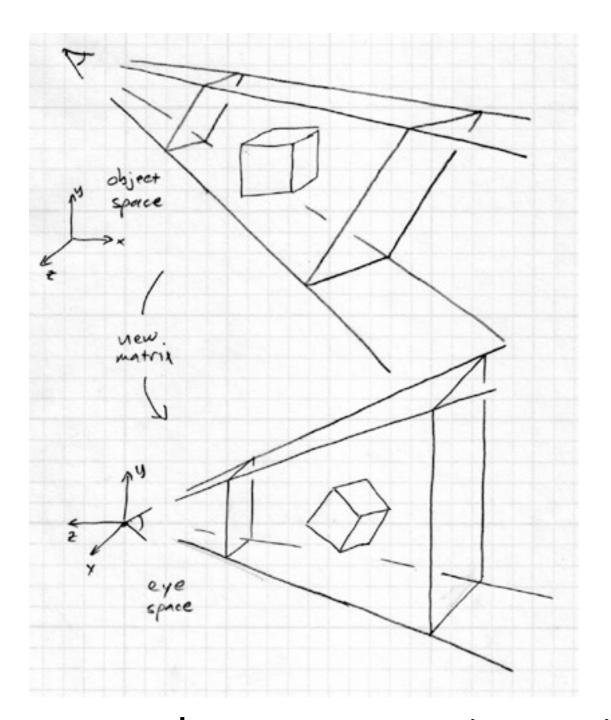

$$F_c = \begin{bmatrix} | & | & | & | \\ \mathbf{u} & \mathbf{v} & \mathbf{w} & \mathbf{e} \\ | & | & | & | \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

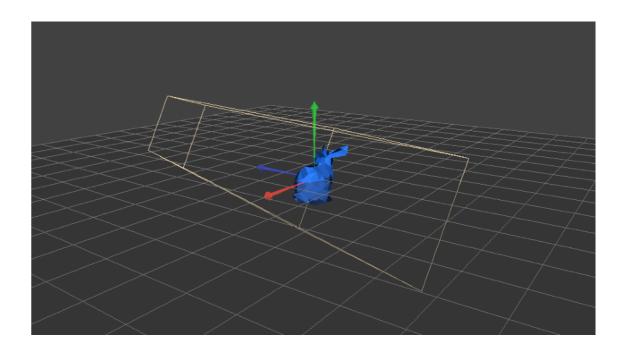

in this interpretation, we first constructed the ray in eye space,
 then transformed it to world space.

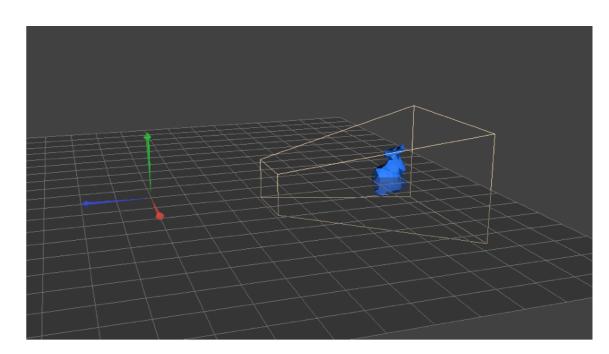

Camera and modeling matrices

- The preceding transforms start from eye coordinates
 - before we apply those we need to transform into that space
- Transform from world (canonical) to eye space is traditionally called the viewing matrix
 - it is the canonical-to-frame matrix for the camera frame
 - that is, F_c^{-1}
- Remember that geometry would originally have been in the object's local coordinates; transform into world coordinates is called the $modeling\ matrix$, M_m
- Note many programs combine the two into a modelview matrix and just skip world coordinates

Viewing transformation

the camera matrix rewrites all coordinates in eye space

Orthographic transformation chain

- Start with coordinates in object's local coordinates
- Transform into world coords (modeling transform, M_m)
- Transform into eye coords (camera xf., $M_{\text{cam}} = F_c^{-1}$)
- Orthographic projection, M_{orth}
- Viewport transform, M_{vp}

$$\mathbf{p}_s = \mathbf{M}_{\mathrm{vp}} \mathbf{M}_{\mathrm{orth}} \mathbf{M}_{\mathrm{cam}} \mathbf{M}_{\mathrm{m}} \mathbf{p}_o$$

$$\begin{bmatrix} x_s \\ y_s \\ z_c \\ 1 \end{bmatrix} = \begin{bmatrix} \frac{n_x}{2} & 0 & 0 & \frac{n_x - 1}{2} \\ 0 & \frac{n_y}{2} & 0 & \frac{n_y - 1}{2} \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \frac{2}{r - l} & 0 & 0 & -\frac{r + l}{r - l} \\ 0 & \frac{2}{t - b} & 0 & -\frac{t + b}{t - b} \\ 0 & 0 & \frac{2}{n - f} & -\frac{n + f}{n - f} \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mathbf{u} & \mathbf{v} & \mathbf{w} & \mathbf{e} \\ 0 & 0 & 0 & 1 \end{bmatrix}^{-1} \mathbf{M}_{\mathbf{m}} \begin{bmatrix} x_o \\ y_o \\ z_o \\ 1 \end{bmatrix}$$

Clipping planes

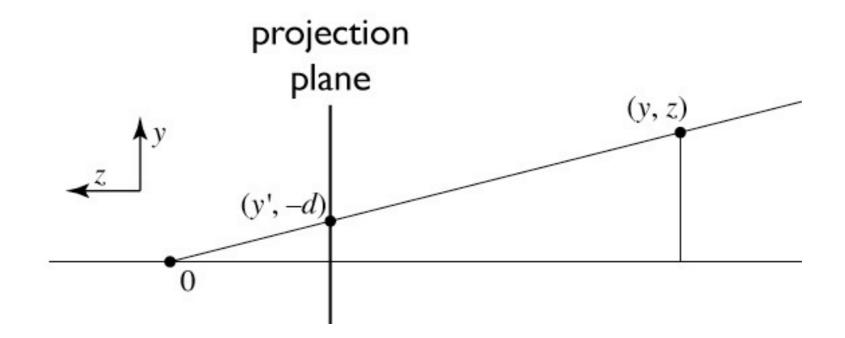

- In object-order systems we always use at least two clipping planes that further constrain the view volume
 - near plane: parallel to view plane; things between it and the viewpoint will not be rendered
 - far plane: also parallel; things behind it will not be rendered

These planes are:

- partly to remove unnecessary stuff (e.g. behind the camera)
- but really to constrain the range of depths (we'll see why later)

Perspective projection

similar triangles:

$$\frac{y'}{d} = \frac{y}{-z}$$
$$y' = -\frac{dy}{z}$$

Homogeneous coordinates revisited

- Perspective requires division
 - that is not part of affine transformations
 - in affine, parallel lines stay parallel
 - therefore not vanishing point
 - therefore no rays converging on viewpoint
- "True" purpose of homogeneous coords: projection

Homogeneous coordinates revisited

Introduced w = I coordinate as a placeholder

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} \rightarrow \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

- used as a convenience for unifying translation with linear
- Can also allow arbitrary w

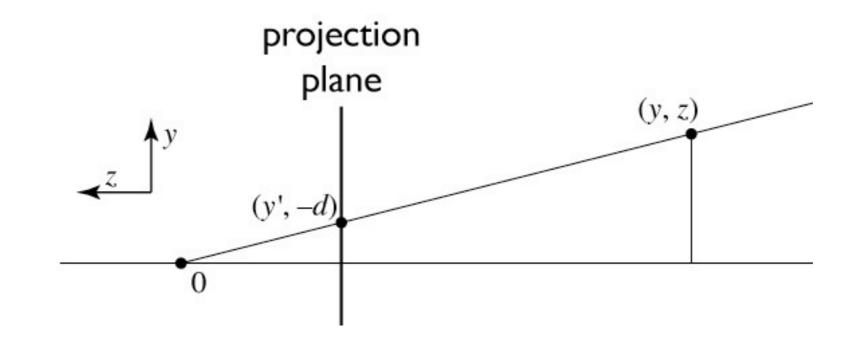

$$egin{bmatrix} x \ y \ z \ 1 \end{bmatrix} \sim egin{bmatrix} wx \ wy \ wz \ w \end{bmatrix}$$

Implications of w

$$egin{bmatrix} x \ y \ z \ 1 \end{bmatrix} \sim egin{bmatrix} wx \ wy \ wz \ w \end{bmatrix}$$

- All scalar multiples of a 4-vector are equivalent
- When w is not zero, can divide by w
 - therefore these points represent "normal" affine points
- When w is zero, it's a point at infinity, a.k.a. a direction
 - this is the point where parallel lines intersect
 - can also think of it as the vanishing point
- Digression on projective space

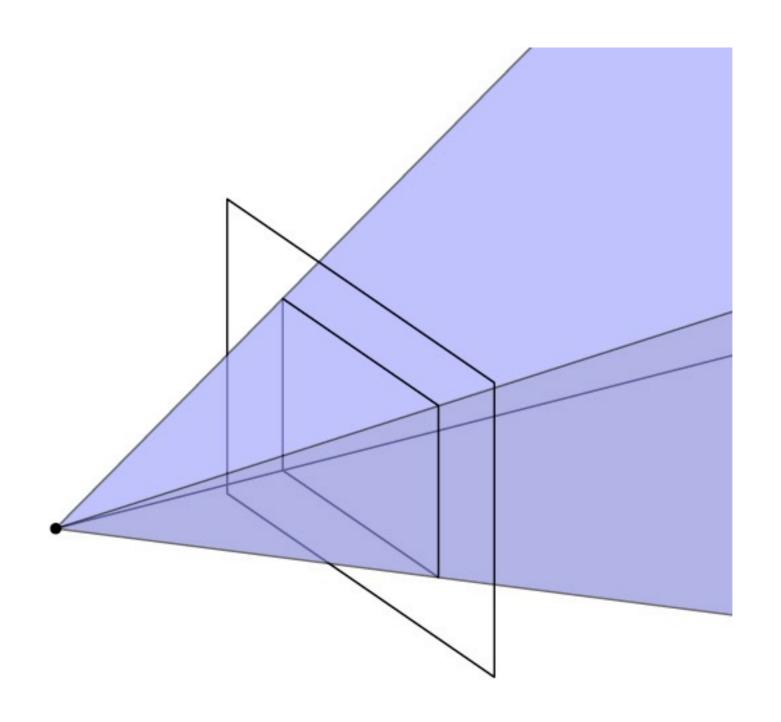

Perspective projection

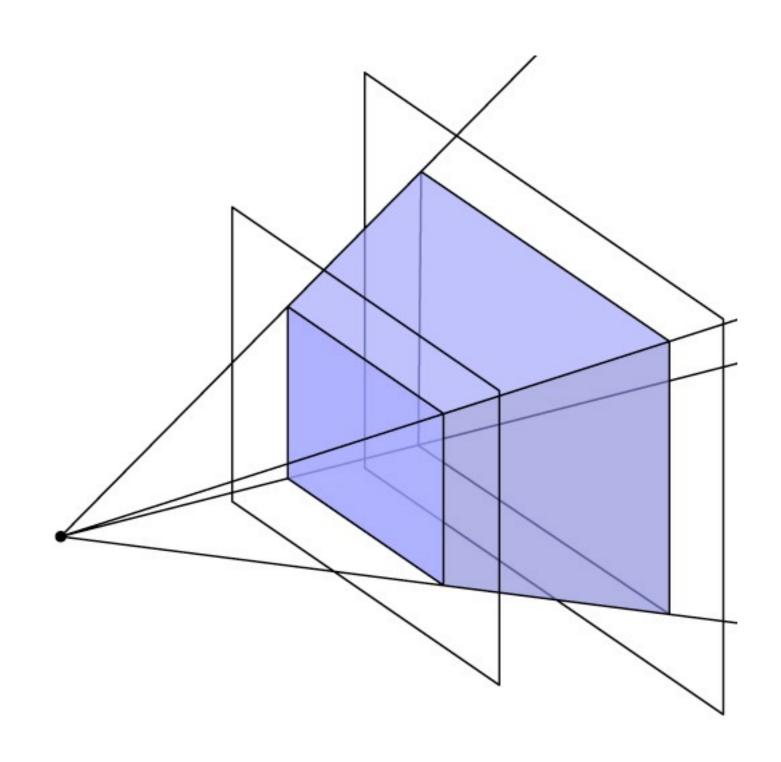

to implement perspective, just move z to w:

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} -dx/z \\ -dy/z \\ 1 \end{bmatrix} \sim \begin{bmatrix} dx \\ dy \\ -z \end{bmatrix} = \begin{bmatrix} d & 0 & 0 & 0 \\ 0 & d & 0 & 0 \\ 0 & 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

View volume: perspective

View volume: perspective (clipped)

Carrying depth through perspective

- Perspective has a varying denominator—can't preserve depth!
- Compromise: preserve depth on near and far planes

$$egin{bmatrix} x' \ y' \ z' \ 1 \end{bmatrix} \sim egin{bmatrix} ilde{x} \ ilde{y} \ ilde{z} \ -z \end{bmatrix} = egin{bmatrix} d & 0 & 0 & 0 \ 0 & d & 0 & 0 \ 0 & 0 & a & b \ 0 & 0 & -1 & 0 \end{bmatrix} egin{bmatrix} x \ y \ z \ 1 \end{bmatrix}$$

- that is, choose a and b so that z'(n) = n and z'(f) = f.

$$\tilde{z}(z) = az + b$$

$$z'(z) = \frac{\tilde{z}}{-z} = \frac{az + b}{-z}$$
want $z'(n) = n$ and $z'(f) = f$
result: $a = -(n+f)$ and $b = nf$ (try it)

Official perspective matrix

- Use near plane distance as the projection distance
 - i.e., d = -n
- Scale by –I to have fewer minus signs
 - scaling the matrix does not change the projective transformation

$$\mathbf{P} = \begin{bmatrix} n & 0 & 0 & 0 \\ 0 & n & 0 & 0 \\ 0 & 0 & n+f & -fn \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

Perspective projection matrix

Product of perspective matrix with orth. projection matrix

$$\mathbf{M}_{\mathrm{per}} = \mathbf{M}_{\mathrm{orth}} \mathbf{P}$$

$$= \begin{bmatrix} \frac{2}{r-l} & 0 & 0 & -\frac{r+l}{r-l} \\ 0 & \frac{2}{t-b} & 0 & -\frac{t+b}{t-b} \\ 0 & 0 & \frac{2}{n-f} & -\frac{n+f}{n-f} \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} n & 0 & 0 & 0 \\ 0 & n & 0 & 0 \\ 0 & 0 & n+f & -fn \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} \frac{2n}{r-l} & 0 & \frac{l+r}{l-r} & 0\\ 0 & \frac{2n}{t-b} & \frac{b+t}{b-t} & 0\\ 0 & 0 & \frac{f+n}{n-f} & \frac{2fn}{f-n}\\ 0 & 0 & 1 & 0 \end{bmatrix}$$

Perspective transformation chain

- Transform into world coords (modeling transform, M_m)
- Transform into eye coords (camera xf., $M_{\text{cam}} = F_c^{-1}$)
- Perspective matrix, P
- Orthographic projection, M_{orth}
- Viewport transform, M_{vp}

$$\mathbf{p}_s = \mathbf{M}_{\mathrm{vp}} \mathbf{M}_{\mathrm{orth}} \mathbf{P} \mathbf{M}_{\mathrm{cam}} \mathbf{M}_{\mathrm{m}} \mathbf{p}_o$$

$$\begin{bmatrix} x_s \\ y_s \\ z_c \\ 1 \end{bmatrix} = \begin{bmatrix} \frac{n_x}{2} & 0 & 0 & \frac{n_x - 1}{2} \\ 0 & \frac{n_y}{2} & 0 & \frac{n_y - 1}{2} \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \frac{2}{r - l} & 0 & 0 & -\frac{r + l}{r - l} \\ 0 & \frac{2}{t - b} & 0 & -\frac{t + b}{t - b} \\ 0 & 0 & \frac{2}{n - f} & -\frac{n + f}{n - f} \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} n & 0 & 0 & 0 \\ 0 & n & 0 & 0 \\ 0 & 0 & n + f & -fn \\ 0 & 0 & 1 & 0 \end{bmatrix} \mathbf{M}_{\text{cam}} \mathbf{M}_{\text{m}} \begin{bmatrix} x_o \\ y_o \\ z_o \\ 1 \end{bmatrix}$$
